

Mzansi Earn ■■

Skills. Tasks. Opportunities.

A Modern Installable Task-Marketplace App Prototype

Created by Aamina Mongwe • 2026

1. Introduction

Mzansi Earn is a South African task-marketplace app concept designed to connect people with short, clearly described opportunities. It brings profile creation, task discovery, applications and activity tracking into one digital workspace.

- Responsive design for desktop, tablet and mobile
- Installable Progressive Web App (PWA) structure
- Safety-focused approach to task scams

2. The Problem

Finding suitable short tasks can be difficult when opportunities, requirements and applications are spread across different places.

- Users need a simple way to present their skills and experience
- Users need an organised view of task activity
- Task platforms need clear safety practices
- A simple digital workflow can reduce unnecessary complexity

3. The Mzansi Earn Solution

The app follows a simple journey: Create Profile → Find Tasks → Review → Apply → Track.

- Profiles contain name, email, skills and a short bio
- Search and category filters help discover tasks
- Task details show requirements, time and demo reward
- Dashboard records activity

4. Main Features

- User profile creation and editing
- Task discovery, search and filtering
- Task detail screens and demo applications
- Activity dashboard
- Employer-side task posting prototype
- Safety Centre
- Responsive mobile, tablet and desktop interface

5. User Profiles

The upgraded prototype allows a user to create a personal profile with a full name, email address, skills and a short biography.

- Profile information can be edited
- Profile is saved locally on the device in the prototype
- A production version would need secure online authentication and a protected database

6. Task Discovery & Applications

- Browse sample Writing, Data, Research, Design and Admin tasks
- Search by task title, category or description
- Review task information before applying
- Record demo applications in the activity dashboard
- No real employment application is submitted in the prototype

7. Dashboard & Activity

- Demo balance: R1,240
- Sample completed tasks: 8
- Application counter updates during use
- Recent activity shows example statuses
- Displayed earnings are demonstration data only
- No real payments are processed

8. Post a Task

The app also demonstrates the task-owner side of the platform.

- Enter a task title and category
- Add a demo reward
- Describe the task
- Add the sample task to the prototype feed
- Future versions would require verified task owners and moderation

9. Installable App / PWA

Mzansi Earn is structured as an installable Progressive Web App.

- Includes an app manifest
- Includes a service worker for core offline caching
- Can be installed from a compatible browser when installation is offered
- Opens in an app-like standalone window
- Provides a foundation for future mobile development

10. Technology Used

- HTML5 — structure and interface
- CSS3 — responsive design
- Vanilla JavaScript — interactions and app logic
- Local Storage — prototype profile persistence
- PWA Manifest — installation configuration
- Service Worker — basic offline support
- GitHub Pages — deployment

11. Safety & Responsible Design

- Never pay money to access a task
- Avoid sharing unnecessary sensitive information
- Review requirements before applying
- Report suspicious task descriptions
- Prototype does not process real money or collect identity documents
- Production development would require privacy, security, age/worker protections, fraud prevention, moderation, tax and payment compliance

12. Current Prototype vs Future App

Current: local profiles, demo applications, sample earnings, sample tasks and static deployment.

Future: secure accounts, cloud database, verified task owners, real application workflow, notifications, moderation and carefully reviewed payment integration.

13. Innovation & Value

- Combines profiles, tasks and activity tracking in one interface
- South African-focused identity and task-marketplace concept
- Installable web-app approach
- Visible safety guidance
- Expandable foundation for a full platform

14. Conclusion

Mzansi Earn demonstrates how a digital task marketplace can make opportunities easier to discover and organise. The upgraded prototype now includes user profiles and installable-app functionality while keeping real payments and employment actions disabled. Further development can add secure authentication, a backend, verified task owners, moderation and compliant payment infrastructure.
